

Supplementary Table S3. Data source for final infection assignments

Method used to determine infection status in usable mice (n=169)

| Assignment Method                         | Number of Mice | Percentage | Description   |
|---|----------------|------------|---|
| qPCR (tissue)                             | 49             | 29.0%      | Direct infection status from MC.Eimeria               |
| Species call (qPCR/amplicon) <sup>1</sup> | 120            | 71.0%      | Infection status inferred from species identification |

<sup>1</sup> Species identification prioritized qPCR melting curves, with amplicon sequencing as backup
