

Supplementary Table S3. Data source for final infection assignments

Method used to determine infection status in usable mice (n=169)

Assignment Method	Number of Mice	Percentage	Description
qPCR (tissue)	49	29.0%	Direct infection status from MC.Eimeria
Species call (qPCR/amplicon) ¹	120	71.0%	Infection status inferred from species identification

¹ Species identification prioritized qPCR melting curves, with amplicon sequencing as backup
